ABSTRACT

2       The instant invention involves the use of a combination  
3       of preparatory steps in conjunction with mass spectroscopy  
4       and time-of-flight detection procedures to maximize the  
5       diversity of biopolymers which are verifiable within a  
6       particular sample. The cohort of biopolymers verified within  
7       such a sample is then viewed with reference to their ability  
8       to evidence at least one particular disease state; thereby  
9       enabling a diagnostician to gain the ability to characterize  
10      either the presence or absence of said at least one disease  
11      state relative to recognition of the presence and/or the  
12      absence of said biopolymer.
